

Project Executable Files

Date	5 July 2026
Team ID	xxxxxx
Project Name	Flood Prediction System
Maximum Marks	3 Marks

Project Executable Files

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example or similar)	NA
6	Deployed application URL (if hosted)	No
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

/Flood Prediction System

— app.py	- Flask application entry point
— Flood_Prediction.ipynb	- Machine learning model development
— floods.save	- Trained XGBoost model
— transform.save	- Saved StandardScaler
— flood_prediction.xlsx	- Dataset
— requirements.txt	- Python dependencies
— README.md	- Project setup instructions

— templates/	
— home.html	
— index.html	
— chance.html	
— no_chance.html	

— static/	
— main.css	
— main.js	
— flood.jpg	

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	Not Hosted (Local Deployment)
Login Credentials (Demo)	Not Applicable
Platform / Hosting Provider	Local Flask Development Server
Repository Link	Repository Link
Demo Video Link	Demo Video Link

Step 4: Run Instructions

1. Clone or download the project repository.
2. Open the project folder in Visual Studio Code or any Python IDE.
3. Install the required dependencies using:
`pip install -r requirements.txt`
4. Run the Flask application:
`python app.py`
5. Open the browser and visit:
`http://127.0.0.1:5000/`
6. Enter the required weather parameters and click "Predict Flood" to view the prediction result.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	The application runs only on a local server.	Can be deployed on Render, AWS, or another cloud platform in the future.
2	No real-time weather API integration.	Currently uses manually entered weather parameters.
3	Single-user application without authentication.	User login and role management can be added in future versions.
